Project Title: Retail Sales Performance Analysis

1. Problem Statement

Our retail store owner does not know which product sells most, which region gives most profit, and which customers are best. Because of this, he is buying wrong products and losing profit. My job is to use sales data to find answers and help him increase profit.

2. Stakeholders

Business Owner - Wants to know total profit and growth
Sales Manager - Wants to know which product to sell more
Inventory Manager - Wants to know which product to keep in stock
Customer - Wants offers (indirect)

3. Business Questions

What is total sales every month?
Which month has highest sales?
Which Top 5 products sell the most?
Which category makes most profit?
Which region gives highest sales?
Who are Top 10 customers?
What is profit margin?
Does more cost mean more profit?
Does discount reduce profit?
Can we predict next month sales?

4. Project Scope

IN Scope (I will do this): Sales data analysis, Product/Region/Customer analysis, Power BI dashboard, ML prediction.
OUT of Scope (I will NOT do this): Real-time website data, competitor data, because we don't have it.
